CCU-D50P Camera Control Unit

Features

- Interfaces with Sony DXC-D55P Series digital cameras via its associated CA-D50 Camera Adaptor.
- The output of the CA-D50 Camera Adaptor is transferred to the CCU-D50P Camera Control Unit as a component digital SDI(*1) signal via a Sony CCZ-A 26-pin cable up to 75 m long.
- The distance between the CA-D50 Camera Adaptor and CCU-D50P Camera Control Unit can be extended to a maximum 200 m by providing a separate low loss coaxial video cable to carry the SDI signal between the two units.
- Outputs analogue composite and one of the following: component digital SDI, analogue component (Y/R-Y/B-Y or RGB), or S-video(*2).
- Flexible intercom connectivity allows the interfacing of 2-wire or 4-wire systems.
- Green tally indication included for use in mid to large-scale camera operations.
- The RCP-D50 can be connected to the CCU-D50P.

PDJ-C1080 Professional Disc Cart Machine

Equally suitable for both transmission and storage applications. The PDJ-C1080 Professional Disc Cart Machine combines the robustness of cart based AV payout with the advantages of the networkable non-linear XDCAM optical disc-based storage media.

Features

The PDJ-C1080 Professional Disc Cart is an automatic changer system for optical disc cartridges that features multiple video decks (PDW-1500 Professional Disc Recorders) and disc cartridge shelves called "bin units". The PDJ-C1080 has the capacity for up to 4 PDW-1500 decks, with bins to hold up to 80 discs included in the standard product. In other words, capacity is provided to load up to 113 hours of program material making this an ideal solution for automated playout & recording applications.

By using standard VCC protocol for control, the PDJ-C1080 has been designed as a "drop-in" replacement for existing flexicart systems, requiring minimal re-programming to interface with popular automation systems and reducing disruption to existing workflows.

PDJ-CS10 Cart Interface Software

Configured with PDJ-CS10 Cart Interface Software, the PDJ-C1080 and PDJ-A640 can interface with MXF-compliant editing and asset management systems from other leading vendors. Professional Discs resident in the PDJ-C1080 or PDJ-A640 appear to external systems via standard FTP or CIFS protocols as a shared network drive. The contents of each Professional Disc appear as a subfolder of the shared drive. The PDJ-CS10 software application provides powerful disc capacity management, automatically storing clips to an available Professional Disc of the appropriate video format and with available free disc space.

Quick restores from archived content

Restoring content from the near-line archive is quicker than with tape. The ultra-reliable robotic loader can select the required disc in less than 30 seconds, and content can be restored from disc to the main news production system twice as fast as real time. The result? A 10-minute piece can be restored from archive and available to on-line users for editing in just over 5 minutes.

Simple, web-based management interface

All file management and system functions – including Disc ID, Title, Bin Number, File and Last Access date – can be reviewed via an easy-to-use browser based interface. This allows the cart operator to quickly search for and identify Professional Discs, with tracking of both near-line discs resident in the PDJ-C1080 or PDJ-A640 robots as well as discs moved off-line to shelf storage.

System Requirements

The following environment is recommended for PDJ-CS10.

- CPU: Intel Pentium 4, or Xeon, 2.8GHz over.
- Memory: 2GB
- HDD: 1st 80GB, 2nd 250GB
- Network: 1000Base-T
- OS: Preinstall Red Hat(R) Enterprise Linux ES 3 (32bit)

DVS-9000 Production Switcher Processor

Compared to conventional SD switchers, the DVS-9000 Series offers greater system flexibility, a range of enhanced functions and a more compact design. The system-control structure and setup/effect data of the DVS-9000 Series switchers are compatible with the MVS-8000 Series switchers. This enables you to configure a mixed DVS-9000 Series and MVS-8000 Series setup, and also provides a smooth migration path from SD to HD operations, with minimal cost and system reconfiguration.

Features

CD Architect 5.2

Professional Red Book audio CD mastering software

Produce professional audio CDs to Red Book specification with CD Architect™ software. It's everything you need to produce professional CDs from beginning to end. Perform full PQ code editing including track and index positions, ISRC codes, and pause times. With CD Architect software you can apply effects to individual tracks, sections of a track, or the master bus. Create live-style CDs with audio in the time between tracks, apply volume envelopes and event ASR envelopes, and even create hidden tracks. Create custom crossfades and generate disc-at-once premasters suitable for professional replication. CD Architect software uses simple drag-and-drop operations and supports most CD burners.

Ziris Create BZSQ-C001

Ziris Create Lite Single Software License

BZSQ-C101

Ziris Create Single Software License

(Version 4.00 and later)

Ziris Create provides a web based system capable of importing media from multiple sources (video, audio, picture and text files), to create and edit playlists, schedule and deliver content to playout devices such as Ziris View, View SD, View HD and the BKM-FW50 Digital Signage Board to show tailored content on individual screens.

Ziris-Create Lite

Entry-level Digital Signage playlist authoring software, for the BKM-FW50 and BZSQ-V001 Ziris View Lite networked playout devices only.

The BKM-FW50 is an IP addressable Streaming Receiver Adaptor for the Sony Public Display FWD series.

Ziris View Lite is application software, operating on either Windows XP or MAC platform, allowing the timely playout of single layer content, when authored within Ziris Create Lite.

BZSQ-C001 Ziris Create Lite

Description

Ziris Create Lite, Entry Level content authoring software.

Software Platform

Windows 2003 server

Web Browser Based

Multiple user and remote log in. Password protection for security.

User Friendly Interface

Ziris Create Lite is simple to operate, the GUI is informative, unclustered and navigation to create and control is easily performed.

Easy play-list creation with Slide Show function

The use of drag and drop of media to create a playlist supports the entire concept of fast, efficient and effective workflow processes.

A Slide Show dialogue allows users to select content from the collections and add them to the Slide Show. The order of the images and video can be changed using the "Move Up" and "Move down" buttons. A preview of the Show is shown along the bottom of the dialogue. The content currently selected in the collection may be previewed.

Week schedule

Slide Show play-lists can be created for every day of the week.

One Platform

Ziris Create Lite offers one platform for handling different types of content such as multiple format support, video, graphics and audio. With no secondary systems required, this makes it's so much simpler to use. What's more, unlike other systems Ziris Create makes a copy of the content to ensure it's always available to the operator.

Simple Media Storage

Media is stored locally and managed on a PC. Files are stored by file type and are user configured – so you know exactly where to find them. It's totally intuitive and simple to use.

Thumbnail File Identification

The use of thumbnails to identify content allows 'at a glance' recognition of the media within the collections and ready for use.

Simple Transfer

Content is transferred and stored locally. No pre-rendering is required, thus changes are simple and fast.

BZSQ-C101 Ziris Create

As above but advanced software for large-scale scaleable systems utilising various media formats, on a number of layers and positions, and flexible scheduling tools.

Features

Ziris Create takes a simple concept of an Administrator and an Author, and brings them to an IP content authoring, publishing & distribution environment. Both Administrator and Author function work together to develop collections of content and deliver them to a distributed network of devices for play out.

The Administrator function allows the user to allocate access privileges and define further User/Author roles. The Administrator function also allows the user to create groups of terminals to which similar content can be developed and delivered. In this way a Group could be all terminals within a retail complex, or all terminals within specific retail areas. Groups are defined on a user basis and in line with the users needs.

The Author function allows users to pull together content from different sources into a single collection. The media within a collection can then be customised with text and graphics. Text can be formatted in terms of font, position, colour size etc and graphics added and positioned for maximum effect within the media.

The whole process is simple to understand and complete. Users simply drag and drop content to a timeline and much like basic editing software, define the times at which graphics and text should appear. Sophisticated media content can be created easily by combining graphics, media and text.

Once created the item is validated i.e. checked for continuity, and consistency and a play out timeline is created for the group of devices. The Author collates media content to the timeline to create a play out schedule. The play out schedule is then uploaded to the remote play out devices manually, automatically, or at a predefined time. The system provides an effective colour-coding scheme to show the stage of the upload process, and whether ultimately, it has been successful.
